

TECHNICALS, DEMYSTIFIED

A crossover isn't a signal. It's an average.

What the 50-day and 200-day lines actually measure —
and what they don't.

THE BASICS

A moving average is just an average.

The mean closing price over the last N days, recalculated fresh every day. It smooths out the daily noise so the underlying trend is easier to see.

TWO SPEEDS

50-day vs. 200-day

One tracks the recent trend. The other tracks the long one — same price data, two different windows.

THE CROSSOVER

Price > 50-day > 200-day.

That alignment is what the scoring engine calls a **textbook uptrend** — its single biggest input to a stock's technicals score.

THE CATCH

It's a lagging indicator.

All three lines describe where price has already been. None of them know what happens tomorrow.

**One input among several —
never a trade signal on its own.**
